COPILOT

MORE

In **Bash**, to redirect both **stdout** (file descriptor 1) and **stderr** (file descriptor 2) to the same file, you can use:

Bash

[Copy](#)

```
command > output.log 2>&1
```

Explanation:

- `>` — redirects **stdout** (FD 1) to `output.log`.
- `2>&1` — redirects **stderr** (FD 2) to wherever **stdout** is currently going (in this case, `output.log`).

Bash File Redirection [1](#) [2](#) [3](#)

In **Bash**, you can redirect a file into a command's standard input (stdin) so the command reads from the file instead of the keyboard. This is done using the `<` operator.

Example:

```
# Reads content of input.txt as stdin for sort
sort < input.txt
```

Here, `sort` doesn't wait for user input — it takes its data directly from `input.txt`.

Redirecting Input from a File Use `< filename` to feed a file's contents into a command:

```
cat < file.txt
```

This makes `cat` read from `file.txt` instead of stdin.

Redirecting Output to a File To save command output to a file:

```
ls > output.txt # Overwrites file
ls >> output.txt # Appends to file
```

`>` overwrites, while `>>` appends.
