✦ AI Overview

Because Google Chrome completely **removed native FTP URL support (ftp://)**, you **cannot download files from an FTP server directly using the standard Chrome browser address bar** .  AnExplorer +1

To download all files from an FTP server onto a Chromebook, you must use one of three reliable methods: an Android app, a desktop Linux application, or a Chrome extension. 

Method 1: Use an Android App (Easiest UI)

If your Chromebook supports the Google Play Store, using an Android file manager is the quickest way to select and download entire folders.  Reddit

1. Open the **Google Play Store** on your Chromebook.
2. Search for and install a capable FTP client like [AndFTP](#) or **Solid Explorer**.
3. Open the app and click the **+** or **Add** button to create a new connection.
4. Select **FTP** (or SFTP/FTPS depending on your server) and enter your server's host IP, username, and password.
5. Before connecting, go to the app's settings and map the local directory to your Chromebook's **Downloads** folder so the files save locally.
6. Connect to the server, use the **multi-select tool** to highlight all files/folders, and tap the **Download** (downward arrow) icon.  Reddit · r/chromeos +4

Method 2: Use FileZilla via Linux (Best for Large Batches)

If you have Linux development environment enabled on your Chromebook, you can use **FileZilla**, which is the industry standard for bulk file transfers.  Medium +2

1. Go to your Chromebook **Settings > Advanced > Developers** and turn on the **Linux development environment**.
2. Open the **Terminal** app from your launcher.
3. Run the following command to update your package list and install FileZilla:

```
hash
```

```
bash
```

```
sudo apt update && sudo apt install filezilla -y
```

Use code with caution.

4. Once installed, launch **FileZilla** from your Linux apps folder.
5. Enter your Host, Username, Password, and Port at the top, then click **Quickconnect**.
6. In the right panel (Remote site), select all files (Ctrl + A).
7. Right-click the highlighted files and click **Download** to save them to your local Linux files directory. 🌐 NOAA Ocean Exploratio... +4

Method 3: Use a Chrome Web Extension (No Installation Required)

If you cannot use Android apps or Linux, you can install a web-based client directly into your browser. 🌐 Reddit

1. Go to the Chrome Web Store and search for an FTP client extension, such as [sFTP Client](#).
2. Open the extension and click **Add New Site / Connection**.
3. Fill in your FTP credentials and click connect.
4. Use the interface to **Multi-Select Files & Folders**, then click the **Download** button to transfer everything to your local drive. 🌐 Reddit · r/chromeos +3

Alternative: Fast Command-Line Bulk Download

If you prefer speed and already have Linux enabled, you can download an entire directory in one go using the terminal `wget` tool: 🌐 Host IT Smart

1. Open your **Terminal** app.
2. Run the following command (replace with your server details):

```
bash
```

```
wget -r ftp://username:password@yourdomain.com/directory/
```

Use code with caution.

 Host IT Smart

Note: The `-r` flag tells the terminal to download recursively, meaning it will grab all files, folders, and subdirectories automatically.  Host IT Smart

Would you like help choosing **which method fits your specific Chromebook model best**, or do you need assistance **setting up the port numbers** for your FTP connection?  Reddit · r/chromeos +1
