Number of Fridays the 13th in May Over the Last 250 Years

To find how many times **May 13th** has fallen on a Friday in the last 250 years, we can use the known **400-year Gregorian calendar cycle** and the fact that the distribution of the 13th of each month across weekdays is fixed Calculatorian +1.

Step 1 — Distribution in a 400-year cycle

In 400 years, there are **4,800 months** (12×400). The 13th of each month lands on each weekday a fixed number of times:

- Friday: **688 times**
- Sunday: 687
- Wednesday: 687
- Monday: 685
- Tuesday: 685
- Thursday: 684
- Saturday: 684 ScienceWorld

This means that over 400 years, **688 of the 4,800 monthly 13ths** are Fridays.

Step 2 — How often May 13th is a Friday

The distribution is uniform across months in the long cycle, so each month (including May) has the same probability of having a Friday the 13th.

In 400 years, the number of times May 13th is a Friday is $688 \div 12 \approx 57.33$.

Since the cycle is exact, the actual count for May 13th Fridays in 400 years is **57 times**.

Step 3 — Adjust for the last 250 years

The 400-year cycle starts on a fixed date (e.g., January 1, 1601). The last 250 years cover part of this cycle.

- From 1601 to 2100 is 500 years, but the Gregorian cycle repeats every 400 years.
- The last 250 years (1701–1950) span **1.25 cycles** of 400 years.
- In $1.25 \times 400 = 500$ years, the number of May 13th Fridays would be $1.25 \times 57 = 71.25$.
- Since we only want 250 years, we take $0.625 \times 57 \approx 35.75$.

Step 4 — Final count

Rounding to the nearest whole number, **May 13th has been a Friday in about 36 of the last 250 years**.

Answer: 36 times in the last 250 years.
